In Response to Office Action mailed December 27, 2006

Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in the application.

1. (Cancelled) A filter circuit, comprising:

a plurality of cascaded filters; and

a bypass circuit coupled across one of the cascaded filters.

- 2. (Currently Amended) The filter circuit of claim 11 4 wherein the bypass circuit comprises a switch.
- (Currently Amended) The filter circuit of claim 11 4 further comprising a plurality of bypass circuits including the bypass circuit, the bypass circuit each being coupled across a different one of the cascaded filters.
- 4. (Original) The filter circuit of claim 3 wherein each of the bypass circuits are adapted for individual control.
- 5. (Original) The filter circuit of claim 3 wherein the bypass circuits each comprises a switch.
- (Currently Amended) The filter circuit of claim 11 4 wherein the cascaded filters 6. each comprises a biquad filter.
- 7. (Currently Amended) The filter circuit of claim 11 4 wherein the cascaded filters each comprises a complex filter.
- 8. (Currently Amended) The filter circuit of claim 11 4 wherein the cascaded filters each comprises a differential filter.

In Response to Office Action mailed December 27, 2006

 (Currently Amended) The filter circuit of claim 11 + wherein the cascaded filters each comprises a pole and a zero.

 (Currently Amended) The filter circuit of claim 11 + wherein the cascaded filters each comprises a complex filter with a pole and a zero.

11. (Currently Amended) A filter circuit, comprising:

a plurality of cascaded filters; and

a bypass circuit coupled across one of the cascaded filters,

The filter circuit of claim 1 wherein the cascaded filters each comprises first and second amplifiers each having a feedback loop comprising a feedback resistor and feedback capacitor coupled in parallel.

 (Original) The filter circuit of claim 11 wherein at least one of the feedback resistors is programmable.

13. (Original) The filter circuit of claim 12 wherein said at least one programmable feedback resistor comprises a plurality of resistors coupled in series, said plurality of resistors each having a switch coupled thereacross.

 (Original) The filter circuit of claim 11 wherein at least one of the feedback capacitors is programmable.

15. (Original) The filter circuit of claim 14 wherein said at least one programmable feedback capacitor comprises a plurality of capacitors coupled in parallel, said plurality of capacitors each having a switch coupled thereacross.

16. (Original) The filter circuit of claim 11 wherein the cascaded filters each comprises a first cross coupled resistor coupled between an output of the first amplifier and an

imenument dated January 6, 2007

In Response to Office Action mailed December 27, 2006

input of the second amplifier, and a second cross coupled resistor coupled between an output of the second amplifier and an input of the first amplifier.

- 17. (Original) The filter circuit of claim 16 wherein the cascaded filters each comprises a first input resistor coupled to the input of the first amplifier, and a second input resistor coupled to the input of the second amplifier.
- 18. (Original) The filter circuit of claim 16 wherein the cascaded filters each comprises an input capacitor having one end coupled to the first input resistor and a second end coupled to the second input resistor.
- (Original) The filter circuit of claim 18 wherein at least one of the capacitors is programmable.
- 20. (Original) The filter circuit of claim 19 wherein said at least one programmable capacitor comprises a plurality of capacitors coupled in parallel, said plurality of capacitors each having a switch coupled thereacross.
- (Original) The filter circuit of claim 18 wherein at least one the resistor is programmable.
- 22. (Original) The filter circuit of claim 21 wherein said at least one programmable resistors comprises a plurality of resistors coupled in series, said plurality of resistors each having a switch coupled thereacross.
 - 23. (Cancelled) A filter circuit, comprising: a plurality of cascaded filters; and

bypass means for bypassing at least one of the cascaded filters.

In Response to Office Action mailed December 27, 2006

 (Currently Amended) The filter circuit of claim 31 23 wherein the bypass means comprises a switch coupled across one of the cascaded filters.

 (Currently Amended) The filter circuit of claim 31 23 wherein the bypass means comprises a plurality of switches each being coupled across a different one of the cascaded filters.

(Currently Amended) The filter circuit of claim 31 23 wherein the switches each
comprises means for being individually controlled.

 (Currently Amended) The filter circuit of claim 31 23 wherein the cascaded filters each comprises a biquad filter.

28. (Currently Amended) The filter circuit of claim <u>31</u> 23 wherein the cascaded filters each comprises a complex filter.

 (Currently Amended) The filter circuit of claim 31 23 wherein the cascaded filters each comprises means for generating a pole and zero.

(Currently Amended) The filter circuit of claim 31 23 wherein the cascaded filters
each comprises a complex filter, the complex filters each comprising means for generating a pole
and zero.

31. (Currently Amended) A filter circuit, comprising:

a plurality of cascaded filters; and

bypass means for bypassing at least one of the cascaded filters,

The filter circuit of claim 23 wherein the cascaded filters each comprises first and second amplifiers each having a feedback loop comprising a feedback resistor and feedback capacitor coupled in parallel.

U.S. Application No. 09/692,420, filed October 19, 2000 Attorney Docket No. 15262US01 (39385/CAG/B600)

Amendment dated January 6, 2007

In Response to Office Action mailed December 27, 2006

32. (Original) The filter circuit of claim 31 wherein at least one of the feedback

resistors comprises means for being programmed to one of a plurality of resistive values.

33. (Original) The filter circuit of claim 32 wherein the means for being programmed

comprises a plurality of resistors coupled in series, said plurality of resistors each having a

switch coupled thereacross.

34. (Original) The filter circuit of claim 31 wherein at least one of the feedback

capacitors comprises means for being programmed to one of a plurality of capacitive values.

35. (Original) The filter circuit of claim 34 wherein the means for being programmed

comprises a plurality of capacitors coupled in parallel, said plurality of capacitors each having a

switch coupled thereacross.

36. (Original) The filter circuit of claim 31 wherein the cascaded filters each

comprises a first cross coupled resistor coupled between an output of the first amplifier and an

input of the second amplifier, and a second cross coupled resistor coupled between an output of

the second amplifier and an input of the first amplifier.

37. (Original) The filter circuit of claim 36 wherein the cascaded filters each

comprises a first input resistor coupled to the input of the first amplifier, and a second input

resistor coupled to the input of the second amplifier.

38. (Original) The filter circuit of claim 37 wherein the cascaded filters each

comprises an input capacitor having one end coupled to the first input resistor and a second end

coupled to the second input resistor.

Page 6 of 27

In Response to Office Action mailed December 27, 2006

39. (Original) The filter circuit of claim 38 wherein at least one of the capacitors comprises means for being programmed to one of a plurality of capacitive values.

- 40. (Original) The filter circuit of claim 39 wherein the means for being programmed comprises a plurality of capacitors coupled in parallel, said plurality of capacitors each having a switch coupled thereacross.
- (Original) The filter circuit of claim 38 wherein at least one the resistor comprises means for being programmed to one of a plurality of resistive values.
- 42. (Original) The filter circuit of claim 41 wherein the means for being programmed comprises a plurality of resistors coupled in series, said plurality of resistors each having a switch coupled thereacross.
- (Currently Amended) The filter circuit of claim 31 23 wherein the cascaded filters each comprises a differential filter.
 - 44. (Cancelled) A filter circuit, comprising:
 - a biquad filter;
 - a polyphase filter coupled to the biquad filter; and
- a plurality of bypass circuits each being coupled across a different one of the biquad filters.
- 45. (Currently Amended) The filter circuit of claim 50 [44] further comprising a plurality of biquad filters including the biquad filter, and a plurality of polyphase filters including the polyphase filter, the biquad filters being intertwined with the polyphase filters.
- 46. (Cancelled) The filter circuit of claim 45 further comprising a plurality of bypass circuits each being coupled across a different one of the biquad filters.

In Response to Office Action mailed December 27, 2006

 (Currently Amended) The filter circuit of claim <u>50</u> [44] wherein each of the bypass circuits are adapted for individual control.

- (Currently Amended) The filter circuit of claim 50 [44] wherein the bypass circuits each comprises a switch.
- (Currently Amended) The filter circuit of claim <u>50</u> [44] wherein the filters each comprises a differential filter.
 - (Currently Amended) A filter circuit, comprising:

a biguad filter:

a polyphase filter coupled to the biquad filter; and

a plurality of bypass circuits each being coupled across a different one of the biquad filters,

The filter circuit of claim 44 wherein the biquad filters each comprises first and second amplifiers each having a feedback loop comprising a feedback resistor and feedback capacitor coupled in parallel.

- (Original) The filter circuit of claim 50 wherein at least one of the feedback resistors is programmable.
- 52. (Original) The filter circuit of claim 51 wherein said at least one programmable feedback resistor comprises a plurality of resistors coupled in series, said plurality of resistors each having a switch coupled thereacross.
- (Original) The filter circuit of claim 50 wherein at least one of the feedback capacitors is programmable.

In Response to Office Action mailed December 27, 2006

54. (Original) The filter circuit of claim 53 wherein said at least one programmable feedback capacitor comprises a plurality of capacitors coupled in parallel, said plurality of capacitors each having a switch coupled thereacross.

55. (Previously Presented) A filter circuit, comprising:

a biguad filter; and

a polyphase filter coupled to the biquad filter,

wherein the biquad filters each comprises a first cross coupled resistor coupled between an output of the first amplifier and an input of the second amplifier, and a second cross coupled resistor coupled between an output of the second amplifier and an input of the first amplifier.

- 56. (Original) The filter circuit of claim 55 wherein the biquad filters each comprises a first input resistor coupled to the input of the first amplifier, and a second input resistor coupled to the input of the second amplifier.
- 57. (Original) The filter circuit of claim 56 wherein the biquad filters each comprises an input capacitor having one end coupled to the first input resistor and a second end coupled to the second input resistor.
- (Original) The filter circuit of claim 57 wherein at least one of the capacitors is programmable.
- 59. (Original) The filter circuit of claim 58 wherein said at least one programmable capacitor comprises a plurality of capacitors coupled in parallel, said plurality of capacitors each having a switch coupled thereacross.
- (Original) The filter circuit of claim 57 wherein at least one the resistor is programmable.

U.S. Application No. 09/692,420, filed October 19, 2000 Attorney Docket No. 15262US01 (39385/CAG/B600) Amendment dated January 6, 2007 In Response to Office Action mailed December 27, 2006

- 61. (Original) The filter circuit of claim 60 wherein said at least one programmable resistors comprises a plurality of resistors coupled in series, said plurality of resistors each having a switch coupled thereacross.
 - 62. (Previously Presented) A complex differential filter, comprising:

first and second differential amplifiers each having a differential input and a differential output;

- a first input resistor coupled to a first one of the differential inputs of the first differential amplifier:
- a second input resistor coupled to a second one of the differential inputs of the first differential amplifier;
- a third input resistor coupled to a first one of the differential inputs of the second differential amplifier;
- a fourth input resistor coupled to a second one of the differential inputs of the second differential amplifier;
- a first input capacitor having one end coupled to the first input resistor and another end coupled to the third input resistor;
- a second input capacitor having one end coupled to the second input resistor and another end coupled to the fourth input resistor;
- a third input capacitor having one end coupled to the third input resistor and another end coupled to the second input resistor; and
- a fourth input capacitor having one end coupled to the fourth input resistor and another end coupled to the first input resistor.
- (Original) The complex differential filter of claim 62 wherein at least one of the input resistors is programmable.

In Response to Office Action mailed December 27, 2006

64. (Original) The complex differential filter of claim 63 wherein said at least one programmable input resistor comprises a plurality of resistors coupled in series, said plurality of resistors each having a switch coupled thereacross.

- (Original) The complex differential filter of claim 62 wherein at least one of the input capacitors is programmable.
- 66. (Original) The complex differential filter of claim 65 wherein said at least one programmable input capacitor comprises a plurality of capacitors coupled in parallel, said plurality of capacitors each having a switch coupled thereacross.
- 67. (Original) The complex differential filter of claim 62 wherein the first and second differential amplifiers each comprises a feedback loop comprising a feedback resistor and feedback capacitor coupled in parallel.
- 68. (Original) The complex differential filter of claim 62 wherein the first differential amplifier comprises a first feedback loop coupled between a first one of its differential outputs and the first one of its differential inputs, and a second feedback loop coupled between a second one of its differential outputs and the second one of its differential inputs, the feedback loops each comprising a feedback resistor and feedback capacitor coupled in parallel.
- 69. (Original) The complex differential filter of claim 68 wherein the second differential amplifier comprises a third feedback loop coupled between a first one of its differential outputs and the first one of its differential inputs, and a second feedback loop coupled between a second one of its differential outputs and the second one of its differential inputs, the third and fourth feedback loops each comprising a feedback resistor and feedback capacitor coupled in parallel.

In Response to Office Action mailed December 27, 2006

- 70. (Original) The complex differential filter of claim 69 further comprising a first cross coupled resistor coupled between the first one of the differential outputs of the first differential amplifier and the second one of the differential inputs of the second differential amplifier, a second cross coupled resistor coupled between a second one of the differential outputs of the first differential amplifier and the first one of the differential inputs of the second differential outputs of the second differential amplifier, a third cross coupled resistor coupled between the first one of the differential outputs of the second differential amplifier and the first one of the differential inputs of the first differential amplifier, and a fourth cross coupled resistor coupled between a second one of the differential outputs of the second differential amplifier and the second one of the differential inputs of the first differential amplifier.
- 71. (Original) The complex differential filter of claim 70 wherein at least one of the capacitors is programmable.
- 72. (Original) The complex differential filter of claim 71 wherein said at least one programmable capacitor comprises a plurality of capacitors coupled in parallel, said plurality of capacitors each having a switch coupled thereacross.
- (Original) The complex differential filter of claim 70 wherein at least one the resistor is programmable.
- 74. (Original) The complex filter of claim 73 wherein said at least one programmable resistors comprises a plurality of resistors coupled in series, said plurality of resistors each having a switch coupled thereacross.
- 75. (Previously Presented) A method of complex filtering to extract a signal in a frequency spectrum comprising a plurality of channels, comprising:

selecting one of the channels having the signal;

rejecting an image of the signal in the selected channel; and

In Response to Office Action mailed December 27, 2006

applying gain to the signal, the applied gain being programmable, wherein the channel selection comprises programming an order of complex filtering.

- 76. (Original) The method of claim 75 wherein the channel selection comprises tuning a center frequency of the channel.
- 77. (Original) The method of claim 76 wherein the channel selection further comprises tuning a bandwidth of the channel.
- 78. (Original) The method of claim 75 further comprising introducing a zero to filter a frequency in the selected channel different from a frequency of the signal.
- 79. (Original) The method of claim 75 further comprising introducing a plurality of zeros each filtering a different frequency in the selected channel, the filtered frequencies each being different from a frequency of the signal.
- (Original) The method of claim 79 further wherein the introducing of the zeros comprises programming the number of the zeros introduced.
- (Cancelled) The method of claim 75 wherein the channel selection further comprises programming an order of complex filtering.
- (new) The filter circuit according to claim 11, wherein the filter circuit is part of a single integrated circuit chip of a wireless communications device.
- 83. (new) The filter circuit according to claim 11, wherein the filter circuit is part of an integrated circuit of a receiver in a wireless communications device.

- 84. (new) The filter circuit according to claim 83, wherein the receiver is part of a single integrated circuit chip transceiver in the wireless communications device.
- 85. (new) The filter circuit according to claim 11, wherein the filter circuit is part of a single integrated circuit chip transceiver in a wireless communications device.
- 86. (new) The filter circuit according to claim 11, wherein the filter circuit is part of an integrated circuit chip in a transceiver in a wireless communications device.
- 87. (new) The filter circuit according to claim 86, wherein the wireless communications device performs orthogonal frequency division multiplexing.
- 88. (new) The filter circuit according to claim 86, wherein the wireless communications device performs spread spectrum modulation.
- 89. (new) The filter circuit according to claim 88, wherein the transceiver comprises a single integrated circuit chip transceiver.
- 90. (new) The filter circuit according to claim 86, wherein the wireless communications device performs frequency hopping.
- 91. (new) The filter circuit according to claim 86, wherein the wireless communications device performs direct sequence spread spectrum modulation.
- 92. (new) The filter circuit according to claim 86, wherein the wireless communications device supports communications that use frequency hopping and communications that use direct sequence spread spectrum modulation.

- 93. (new) The filter circuit according to claim 86, wherein the wireless communications device supports communications that use spread spectrum modulation and communications that use orthogonal frequency division multiplexing.
- 94. (new) The filter circuit according to claim 86, wherein the transceiver comprises a single integrated circuit chip transceiver, and wherein the wireless communications device supports a plurality of different wireless spread spectrum communication techniques.
- 95. (new) The filter circuit according to claim 94, wherein the wireless communications device performs orthogonal frequency division multiplexing.
- 96. (new) The filter circuit according to claim 31, wherein the filter circuit is part of a single integrated circuit chip of a wireless communications device.
- 97. (new) The filter circuit according to claim 31, wherein the filter circuit is part of an integrated circuit of a receiver in a wireless communications device.
- 98. (new) The filter circuit according to claim 97, wherein the receiver is part of a single integrated circuit chip transceiver in the wireless communications device.
- 99. (new) The filter circuit according to claim 31, wherein the filter circuit is part of a single integrated circuit chip transceiver in a wireless communications device.
- 100. (new) The filter circuit according to claim 31, wherein the filter circuit is part of an integrated circuit chip in a transceiver in a wireless communications device.
- 101. (new) The filter circuit according to claim 100, wherein the wireless communications device performs orthogonal frequency division multiplexing.

In Response to Office Action mailed December 27, 2006

102. (new) The filter circuit according to claim 100, wherein the wireless communications device performs spread spectrum modulation.

- 103. (new) The filter circuit according to claim 102, wherein the transceiver comprises a single integrated circuit chip transceiver.
- 104. (new) The filter circuit according to claim 100, wherein the wireless communications device performs frequency hopping.
- 105. (new) The filter circuit according to claim 100, wherein the wireless communications device performs direct sequence spread spectrum modulation.
- 106. (new) The filter circuit according to claim 100, wherein the wireless communications device supports communications that use frequency hopping and communications that use direct sequence spread spectrum modulation.
- 107. (new) The filter circuit according to claim 100, wherein the wireless communications device supports communications that use spread spectrum modulation and communications that use orthogonal frequency division multiplexing.
 - 108. (new) The filter circuit according to claim 100, wherein the transceiver comprises a single integrated circuit chip transceiver, and wherein the wireless communications device supports a plurality of different wireless

spread spectrum communication techniques.

109. (new) The filter circuit according to claim 108, wherein the wireless communications device performs orthogonal frequency division multiplexing.

- 110. (new) The filter circuit according to claim 50, wherein the filter circuit is part of a single integrated circuit chip of a wireless communications device.
- 111. (new) The filter circuit according to claim 50, wherein the filter circuit is part of an integrated circuit of a receiver in a wireless communications device.
- 112. (new) The filter circuit according to claim 111, wherein the receiver is part of a single integrated circuit chip transceiver in the wireless communications device.
- 113. (new) The filter circuit according to claim 50, wherein the filter circuit is part of a single integrated circuit chip transceiver in a wireless communications device.
- 114. (new) The filter circuit according to claim 50, wherein the filter circuit is part of an integrated circuit chip in a transceiver in a wireless communications device.
- 115. (new) The filter circuit according to claim 114, wherein the wireless communications device performs orthogonal frequency division multiplexing.
- 116. (new) The filter circuit according to claim 114, wherein the wireless communications device performs spread spectrum modulation.
- 117. (new) The filter circuit according to claim 116, wherein the transceiver comprises a single integrated circuit chip transceiver.
- 118. (new) The filter circuit according to claim 114, wherein the wireless communications device performs frequency hopping.
- 119. (new) The filter circuit according to claim 114, wherein the wireless communications device performs direct sequence spread spectrum modulation.

In Response to Office Action mailed December 27, 2006

120. (new) The filter circuit according to claim 114, wherein the wireless communications device supports communications that use frequency hopping and communications that use direct sequence spread spectrum modulation.

- 121. (new) The filter circuit according to claim 114, wherein the wireless communications device supports communications that use spread spectrum modulation and communications that use orthogonal frequency division multiplexing.
 - 122. (new) The filter circuit according to claim 114,

wherein the transceiver comprises a single integrated circuit chip transceiver, and wherein the wireless communications device supports a plurality of different wireless spread spectrum communication techniques.

- (new) The filter circuit according to claim 122, wherein the wireless 123 communications device performs orthogonal frequency division multiplexing.
- (new) The filter circuit according to claim 55, wherein the filter circuit is part of a single integrated circuit chip of a wireless communications device.
- (new) The filter circuit according to claim 55, wherein the filter circuit is part of an integrated circuit of a receiver in a wireless communications device.
- 126 (new) The filter circuit according to claim 125, wherein the receiver is part of a single integrated circuit chip transceiver in the wireless communications device.
- 127. (new) The filter circuit according to claim 55, wherein the filter circuit is part of a single integrated circuit chip transceiver in a wireless communications device.

- 128. (new) The filter circuit according to claim 55, wherein the filter circuit is part of an integrated circuit chip in a transceiver in a wireless communications device.
- 129. (new) The filter circuit according to claim 128, wherein the wireless communications device performs orthogonal frequency division multiplexing.
- 130. (new) The filter circuit according to claim 128, wherein the wireless communications device performs spread spectrum modulation.
- 131. (new) The filter circuit according to claim 130, wherein the transceiver comprises a single integrated circuit chip transceiver.
- 132. (new) The filter circuit according to claim 128, wherein the wireless communications device performs frequency hopping.
- 133. (new) The filter circuit according to claim 128, wherein the wireless communications device performs direct sequence spread spectrum modulation.
- 134. (new) The filter circuit according to claim 128, wherein the wireless communications device supports communications that use frequency hopping and communications that use direct sequence spread spectrum modulation.
- 135. (new) The filter circuit according to claim 128, wherein the wireless communications device supports communications that use spread spectrum modulation and communications that use orthogonal frequency division multiplexing.
 - 136. (new) The filter circuit according to claim 128, wherein the transceiver comprises a single integrated circuit chip transceiver, and

In Response to Office Action mailed December 27, 2006

wherein the wireless communications device supports a plurality of different wireless spread spectrum communication techniques.

- 137. (new) The filter circuit according to claim 136, wherein the wireless communications device performs orthogonal frequency division multiplexing.
- 138. (new) The complex differential filter according to claim 62, wherein the complex differential filter is part of a single integrated circuit chip of a wireless communications device.
- 139. (new) The complex differential filter according to claim 62, wherein the complex differential filter is part of an integrated circuit of a receiver in a wireless communications device.
- 140. (new) The complex differential filter according to claim 139, wherein the receiver is part of a single integrated circuit chip transceiver in the wireless communications device.
- 141. (new) The complex differential filter according to claim 62, wherein the complex differential filter is part of a single integrated circuit chip transceiver in a wireless communications device.
- 142. (new) The complex differential filter according to claim 62, wherein the complex differential filter is part of an integrated circuit chip in a transceiver in a wireless communications device.
- 143. (new) The complex differential filter according to claim 142, wherein the wireless communications device performs orthogonal frequency division multiplexing.
- 144. (new) The complex differential filter according to claim 142, wherein the wireless communications device performs spread spectrum modulation.

In Response to Office Action mailed December 27, 2006

145. (new) The complex differential filter according to claim 144, wherein the transceiver comprises a single integrated circuit chip transceiver.

- 146. (new) The complex differential filter according to claim 142, wherein the wireless communications device performs frequency hopping.
- 147. (new) The complex differential filter according to claim 142, wherein the wireless communications device performs direct sequence spread spectrum modulation.
- 148. (new) The complex differential filter according to claim 142, wherein the wireless communications device supports communications that use frequency hopping and communications that use direct sequence spread spectrum modulation.
- 149. (new) The complex differential filter according to claim 142, wherein the wireless communications device supports communications that use spread spectrum modulation and communications that use orthogonal frequency division multiplexing.
- 150. (new) The complex differential filter according to claim 142, wherein the transceiver comprises a single integrated circuit chip transceiver, and wherein the wireless communications device supports a plurality of different wireless spread spectrum communication techniques.
- 151. (new) The complex differential filter according to claim 150, wherein the wireless communications device performs orthogonal frequency division multiplexing.

- 152. (new) The method according to claim 75, wherein the method is performed by a single integrated circuit chip of a wireless communications device.
- 153. (new) The method according to claim 75, wherein the method is performed by an integrated circuit of a receiver in a wireless communications device.
- 154. (new) The method according to claim 153, wherein the receiver is part of a single integrated circuit chip transceiver in the wireless communications device.
- 155. (new) The method according to claim 75, wherein the method is performed by a single integrated circuit chip transceiver in a wireless communications device.
- 156. (new) The method according to claim 75, wherein the method is performed by an integrated circuit chip in a transceiver in a wireless communications device.
- 157. (new) The method according to claim 156, wherein the wireless communications device performs orthogonal frequency division multiplexing.
- 158. (new) The method according to claim 156, wherein the wireless communications device performs spread spectrum modulation.
- 159. (new) The method according to claim 158, wherein the transceiver comprises a single integrated circuit chip transceiver.
- 160. (new) The method according to claim 156, wherein the wireless communications device performs frequency hopping.
- 161. (new) The method according to claim 156, wherein the wireless communications device performs direct sequence spread spectrum modulation.

- 162. (new) The method according to claim 156, wherein the wireless communications device supports communications that use frequency hopping and communications that use direct sequence spread spectrum modulation.
- 163. (new) The method according to claim 156, wherein the wireless communications device supports communications that use spread spectrum modulation and communications that use orthogonal frequency division multiplexing.
- 164. (new) The method according to claim 156, wherein the transceiver comprises a single integrated circuit chip transceiver, and wherein the wireless communications device supports a plurality of different wireless spread spectrum communication techniques.
- 165. (new) The method according to claim 164, wherein the wireless communications device performs orthogonal frequency division multiplexing.
